

Shauna Parkes is a Principal Investigator at the French National Centre for Scientific Research (CNRS). She received her PhD in Psychology in 2011 from the University of New South Wales (Australia) and received postdoctoral training at the Brain and Mind Centre (University of Sydney) and the University of Bordeaux. Her research is dedicated to understanding the neural bases of adaptive behaviour using rodent models. Her most significant contributions to date include elucidating the neural circuits supporting complex event predictions and goal-directed behaviours. She has been awarded several competitive research grants (3 as PI and 3 as co-PI) and serves as an elected member of the French Society for Neuroscience and the French National Research Agency. She is also the current chair of the Bordeaux Neurocampus Parity and Inclusion Committee. Her current research explores how context influences choice and decision-making.
